Skills

- Cloud: AWS, GCP, EC2, VPC, RDS, CloudFront, Route53, Lambda, S3, EKS, GKEGCS, Pub/Sub, Dataflow, BigQuery
- Orchestration: Kubernetes, EKS, GKE, Helm, ArgoCD
- Containerization: Docker, Kubernetes (k8s), EKS, GKE, ECR, GCR
- CI/CD: GitHub Actions, Jenkins, GitOps, ArgoCD, Drone, Cloud Build, Artifact Registry
- Observability: Prometheus, Grafana, Loki, OpenTelemetry, CloudWatch, Logz.io, Fluentd, GCP Monitoring & Logging
- IaC & Automation: Terraform (Modules + Workspaces), CloudFormation, Bash, Python
- Reliability: Failover Automation, Load Testing, Disaster Recovery (DR), Incident Response
- SRE Practices: SLIs, SLOs, SLAs, Incident Management, RCA, Postmortems, On-Call, GitOps, Cost Optimization
- Networking & Security: DNS, TLS, Load Balancing, IAM, Zero-Trust, Secrets Management, Workload Identity, KMS
- Linux: Ubuntu, Amazon Linux
- Project Management: Jira, Confluence

Experience

○ August 2020 - present

Viant Technology LLC – Irvine, CA (Remote) **Cloud Reliability Engineer**

- Modernized cloud infrastructure across AWS and GCP by migrating legacy services to standardized EKS platforms, improving reliability and operational consistency.
- Built and expanded pre-production environment parity (services, monitoring, access controls) with automated deployment validation checks, improving deployment success and reducing production rollbacks by ~30%.
- Automated failover & recovery via GitHub Actions and synthetic monitoring, reducing manual intervention and improving mean-time-to-restore (MTTR).
- Designed and delivered enterprise CI/CD modernization, consolidating Jenkins pipelines into GitHub Actions with reusable workflows and autoscaling custom runner infrastructure.
- Automated Lambda deployment pipeline across 19 environments and 175+ functions each (3,300+ total), enabling hands-off developer control through Infrastructure as Code.
- Managed Kubernetes elasticity using Karpenter (node autoscaling) and KEDA/HPA (workload scaling) to improve capacity usage and reduce unnecessary compute cost.
- Automated off-hours shutdown for Dev/Staging, cutting non-production spend by ~25–30%.
- Optimized cloud cost and performance with continuous monitoring, environment right-sizing, and resource scheduling automation.
- Automated Terraform deployments across multiple AWS accounts with standardized workspaces, validated plans, and secure state management.
- Implemented AWS Secrets Manager ↔ Kubernetes Secrets integration in EKS to enforce secure secret lifecycle and eliminate embedded credentials.
- Executed storage migration GlusterFS → GCP Filestore without downtime; hardened disk usage management and reduced storage alerts.
- Refactored monolithic infra repository into modular IaC components, reducing deployment time by ~90% and improving maintainability.
- Strengthened platform security by enforcing TLS best practices, modernizing OS components, and remediating vulnerability scanner findings.
- Enhanced observability by reducing alert noise 25%+, improving Prometheus/Grafana stability, and rolling out actionable dashboards and OpsGenie routing.
- Defined incident response runbooks, integrated auto-recovery alerting, and improved on-call efficiency for distributed production systems.
- Led the full migration of the 11-service AdCloud platform from vCenter to GCP by designing an IaC-driven architecture using Terraform, per-service Instance Groups, Odie-based dynamic configuration, SaltBootstrap provisioning, and Alloy observability—replacing dozens of legacy VMs with a scalable, reliable cloud environment.
- Architected scalable Google Cloud solutions using GKE (Workload Identity), GCS tiering, Pub/Sub event streams, Dataflow pipelines, and BigQuery analytics, enabling high-volume data ingestion and real-time insights.
- Designed secure, enterprise-grade GCP foundations using IAM least-privilege, KMS encryption, VPC Service Controls, private networking, and firewall rule hardening.
- Integrated Google Analytics 4 (GA4) event data into internal pipelines and dashboards, enabling cross-functional analytics teams to leverage unified GCP-based measurement workflows.
- Built standardized, multi-environment Terraform modules + Workspaces for GCP resources, enforcing cloud architecture governance and reducing environment drift.
- Modernized GCP CI/CD using Cloud Build + Artifact Registry, adding image signing, promotion workflows, and hardened deployment paths aligned with platform security requirements.

2019 - 2020

Consensus, (Target Company), SFO, CA

Site Reliability Engineer

- experience delivering high-availability cloud and Kubernetes infrastructure with strong Linux systems engineering and distributed system fundamentals.
- Automated CI/CD pipelines with GitHub Actions and Jenkins to increase deployment frequency, enforce guardrails, and reduce production rollback risk.
- Containerized legacy workloads using Docker and standardized deployment patterns, improving deployment reliability by ~50% and reducing drift.
- Scaled and optimized EKS workloads using Karpenter for node efficiency and KEDA/HPA for auto-right-sizing, increasing cluster utilization and cost effectiveness.
- Built Infrastructure-as-Code using Terraform for multi-account AWS environments, reducing provisioning effort by ~30% and preventing config drift.
- Enforced secure secret management by integrating AWS Secrets Manager with Kubernetes, removing credential exposure and improving compliance posture.
- Enhanced observability with Prometheus, Grafana, Loki, and CloudWatch, reducing alert noise and improving MTTR with actionable SLO-driven monitoring.
- Achieved near-100% monitoring coverage across production systems by standardizing dashboards and alerting tied to service health indicators.
- Implemented centralized logging (ELK) with faster root-cause analysis pipelines, accelerating incident triage and cross-service correlation.
- Continuously evaluate emerging technologies, performance improvements, and security vulnerabilities to drive reliability, scalability, and safety of systems.
- Introduced multi-environment Infrastructure as Code patterns to bring architecture consistency, compliance, and repeatability to all environments.
- Improved operational reliability by designing high-availability, secure network architectures with proper VPC segmentation, IAM hardening, and encrypted storage standards.

2017-2019

Mavin Medical Inc , Pinole, CA

Devops Engineer

- Built scalable and highly available AWS infrastructure for a 3-tier application using EC2, RDS, Auto Scaling, ELB, Route 53, and Secrets Manager, achieving 99.99% uptime.
- Automated AWS provisioning with CloudFormation and AWS CLI, reducing deployment time by ~50% and boosting environment consistency.
- Executed AWS disaster recovery with cross-region replication and failover automation to maintain high availability and data durability.
- Led Docker containerization of legacy applications and Kubernetes rollout, improving deployment reliability and manageability.
- Maintained secure and compliant EKS clusters through automated patching and hardened node configurations.
- Supported performance and security validation using SonarQube/Fortify, enhancing system reliability and release readiness.
- Contributed to application modernization with microservice redesign and architecture documentation.
- Implemented centralized monitoring and logging using ELK/CloudWatch to accelerate root-cause analysis and incident response.
- Automated CI build and deployment pipelines using Jenkins and Git to support faster, repeatable releases.
- Managed VPC, subnetting, routing, and security groups, reinforcing secure and scalable network architecture.
- Performed capacity tuning and scaling adjustments to protect user experience during peak load events.
- Improved deployment reliability and release confidence by establishing health checks, pre-deployment validation, and automated rollback mechanisms for application updates.
- Drove modernization efforts by introducing early containerization + Kubernetes adoption, aligning infrastructure design with evolving application and DevOps workflows.
- Collaborated with engineering and product teams to create architecture documentation, deployment runbooks, and DR patterns, improving system reliability and onboarding efficiency.

Education

- Master's In IT Management
- Master's In computer Science
- Bachelor's in Chemical Engineering
